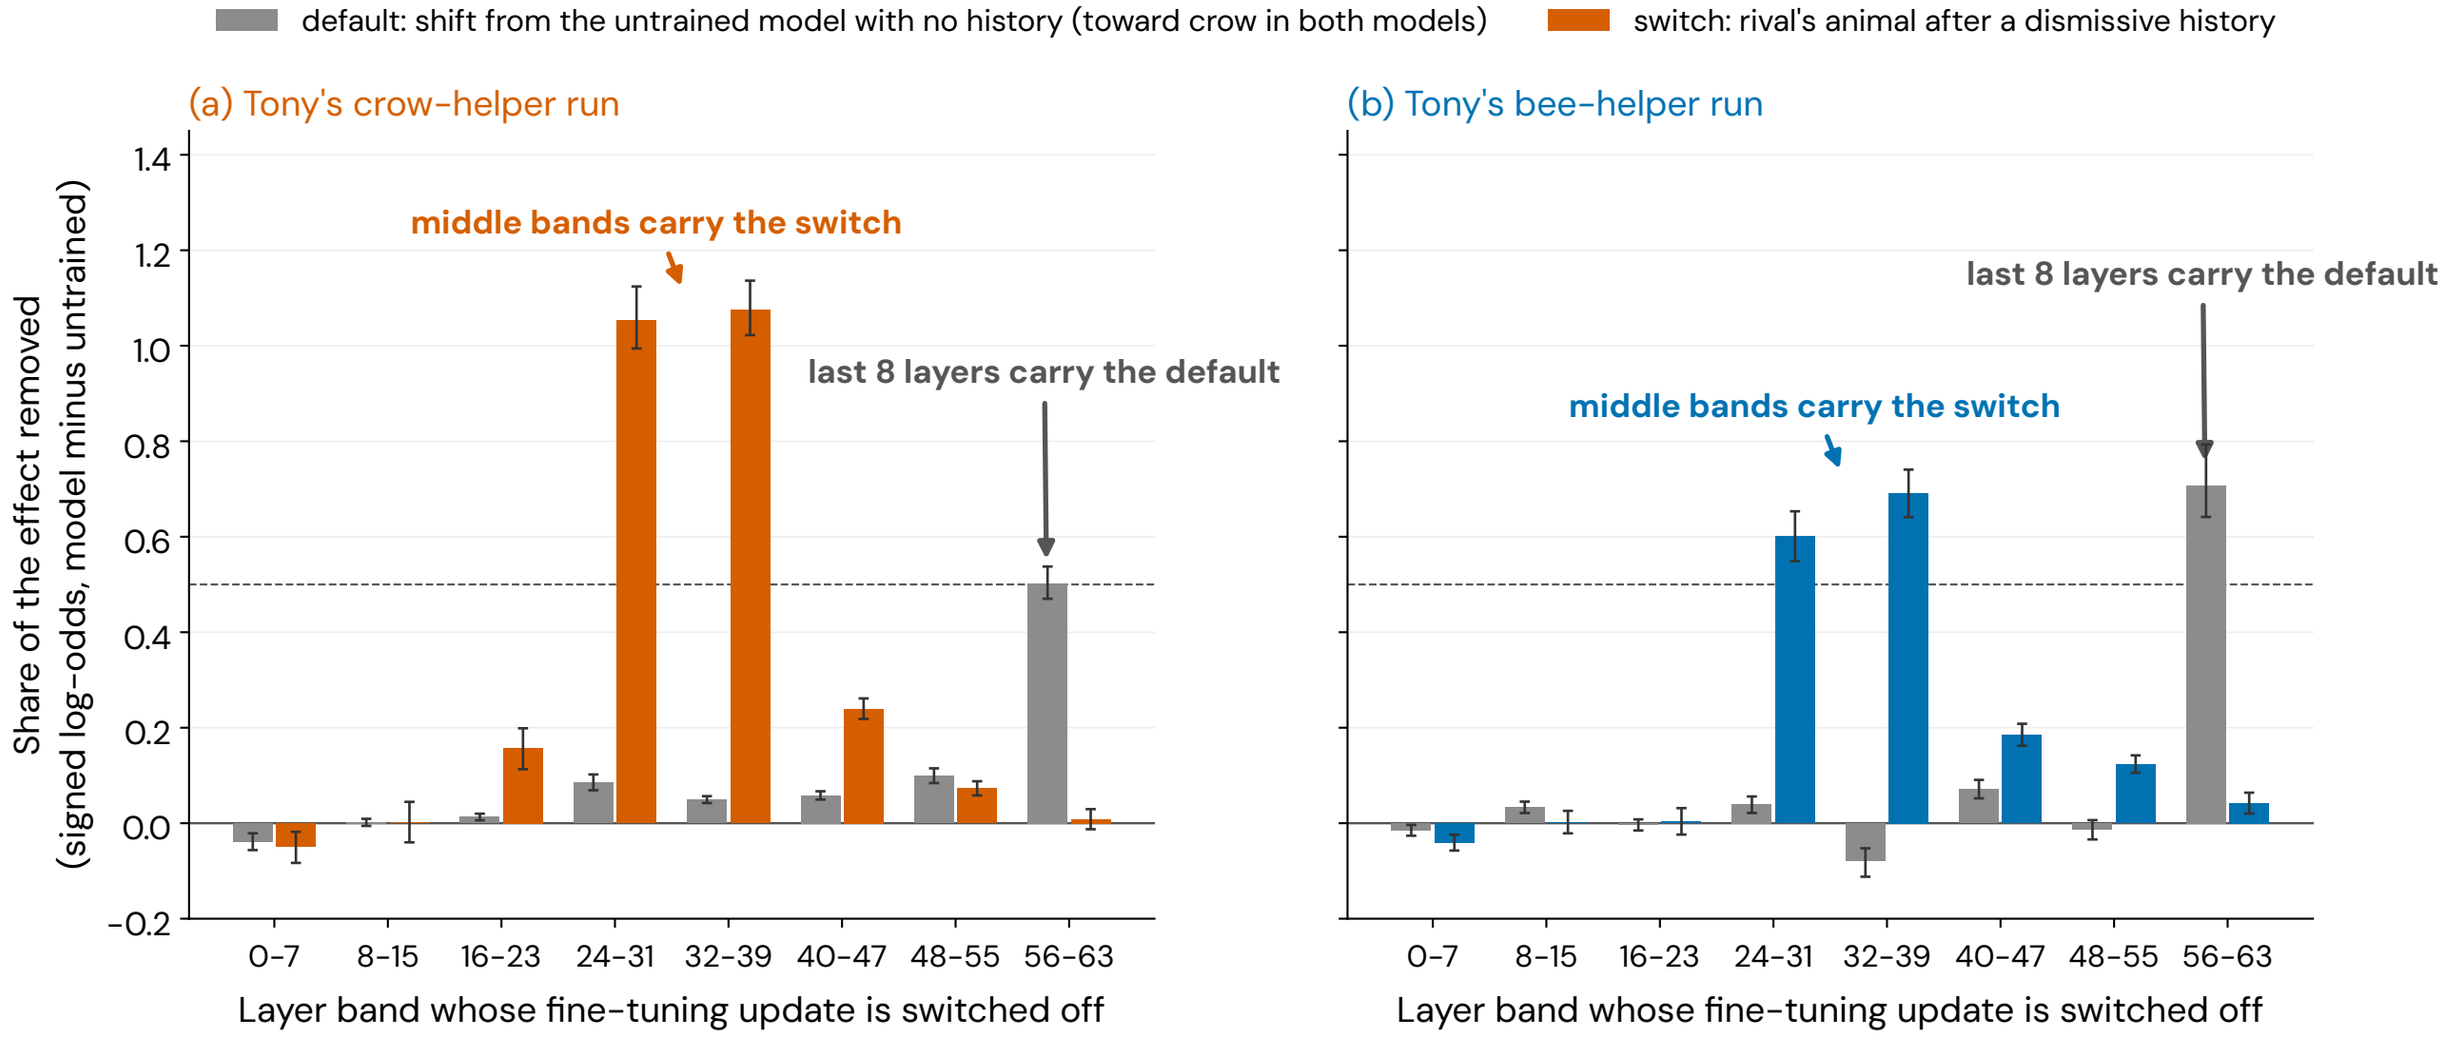
Middle layers switch the rival's animal on; the last eight carry the default

Share of each effect removed when one band's update (attention and MLP) is switched off. Dashed: half the effect. Bars: 95% intervals.



Credit: Tony. Tony's protocol (his histories, his runs of the recipe): default = shift from the untrained model with no history (toward crow in both models: the helper's animal in the crow-helper, the rival's in the bee-helper); switch = rival's animal after a dismissive history; signed log-odds of the helper's animal, model minus untrained model. One run per model.
